Electronics Research, Inc. Introduces new 955 Series FM Band Pass Filter for HD Radio Applications

Chandler, Indiana – September 18, 2006 – Electronics Research, Inc. is introducing a new FM Band Pass Filter product line for IBOC and Low Power Analog FM applications at the NAB Radio Conference in Dallas. The filter series is designed for use as a band pass filter for protection from undesirable cross modulation products and can also be configured as a branch combiner for combining two or three analog or IBOC transmitters into a single antenna. ERI also has a constant impedance combining module available in the 955 Series. The filters are rated at 3 kilowatts average power and can be tuned for any FM operating channel between 88 and 108 MHz.

The filter cavities are sized to provide low insertion loss resulting in minimal temperature rise and reduced transmitter power loss. The individual cavities are loop coupled so that each filter bank can be optimized for the particular application required and can be retuned in the field if necessary. The filters are provided with an integrated floor mounting frame, that can suspended from a ceiling or wall mount, with appropriate optional mounting hardware. The 955 Series filters are available for shipment within 4 to 6 weeks after receipt of order.

About Electronics Research, Inc.

For more than 60 years, ERI has served the broadcast industry with products and services of the highest quality and dependability. Our dedicated staff of engineers, drafters, fabricators, project managers, and installers deliver products to meet your entire broadcast needs, both RF and structural. We take pride in contributing to your success by offering the best broadcast antennas, filters and combiners, transmission line, and towers.
